

## Redox Reactions & Electrolysis.

Q-1) What is oxidation?

[OIL RIG]

- gain of oxygen
- removal of hydrogen
- loss of electrons
- increase in oxidation no.

Q-2) What is reduction?

- >
- gain of hydrogen
  - removal of oxygen
  - gain of electrons
  - decrease in oxidation no.

Q-3) What is oxidation number / state?

> It is a number given to an atom in a compound which describes how oxidised or reduced it is.

(numerical charge value : eg:  $\text{Al}^{3+}$ ).

Q-4) Rules for oxidation no./state.

① The oxidation no. of any uncombined element is zero

eg:  $\text{Cl}_2$ ,  $\text{O}_2$ ,  $\text{Fe}$ ,  $\text{C}$ ...

② The sum of oxidation no. of all atoms in a neutral compound is zero.

eg:  $\text{H}_2\text{SO}_4$ ,  $\text{MgO}$ ,  $\text{NaCl}$ ...

③ The sum of oxidation no. of all atoms in an ion, is equal to the charge on that ion.

$$\text{S} + 4(\text{O}) = -2$$

eg:  $\text{SO}_4^{2-}$

$$\text{S} + 4(-2) = -2$$

$$-8 = -2$$

$$-\text{C} \cdot \text{S} = +6$$

④ The more electronegative element in a substance is given a negative oxidation state.

eg:  $\text{NaCl}$ ,  $\text{HCl}$ ,  $\text{SO}_2$ ,  $\text{CO}_2$ ,  $\text{IO}_3^-$

⑤ Group I elements have oxidation no. +1

Group II elements have oxidation no. +2.

⑥ Oxygen ~~had~~ has oxidation no. -2.

except:  $\text{OF}_2$  &  $\text{O}_2\text{F}_2$

& peroxides:  $\text{H}_2\text{O}_2^-$ ,  $\text{BaO}_2^-$ ,  $\text{Na}_2\text{O}_2^-$

⑦ Hydrogen has oxidation no. +1

except hydrides (-1)

↳ eg:  $\text{NaH}^-$ ,  $\text{CaH}_2^-$

⑧ Fluorine has oxidation no. -1

↳ it's the most electronegative element.

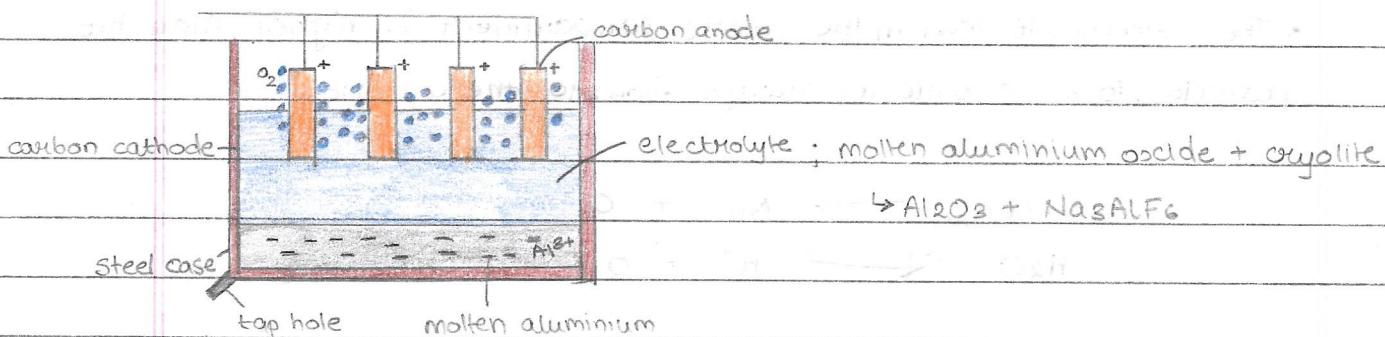

⑨ Chlorine has oxidation no. -1

except ~~in~~ compound with O or F, where it is positive.

eg:  $\text{NaClO}_3$ ,  $\text{NaClO}_4$ ,  $\text{HOCl}^+$

Q-5) Electrolysis - extraction of Aluminium.

Aluminium is extracted from bauxite ore.

- \* Aluminium is dissolved in molten cryolite because cryolite
  - lowers melting point of Aluminium
  - it improves the electrical conductivity of the electrolyte.

at cathode (reduction)  $(Al^{3+} + 3e^- \rightarrow Al) \times 4$  make e<sup>-</sup> same.

at anode (oxidation)  $(2O_2^{2-} \rightarrow O_2 + 4e^-) \times 3$

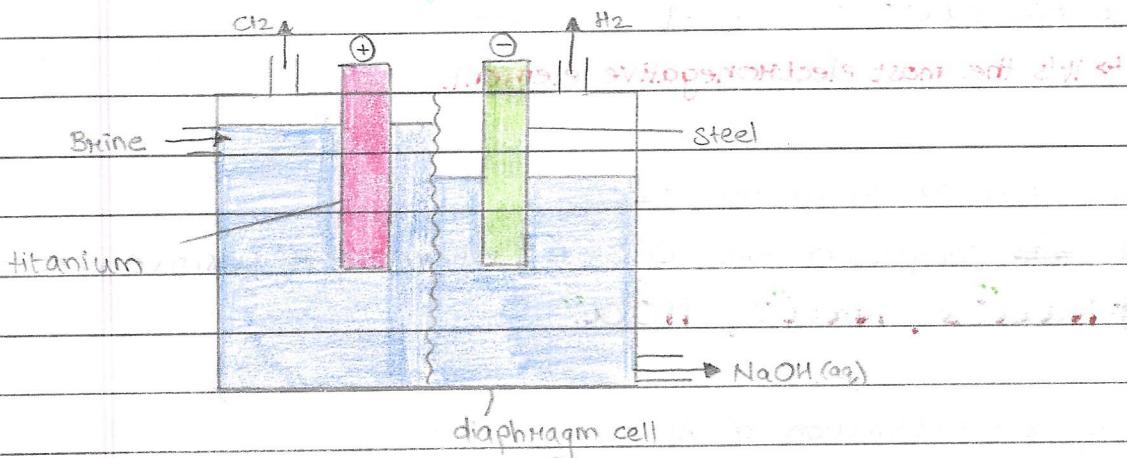

OR

### Q-6) Electrolysis of Brine

- \* Brine is concentrated  $NaCl(aq)$  - with water.

- \* The electrolyte level in the anode compartment is higher than the cathode to make sure it always flows to the cathode.

at anode (oxidation).  $2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$

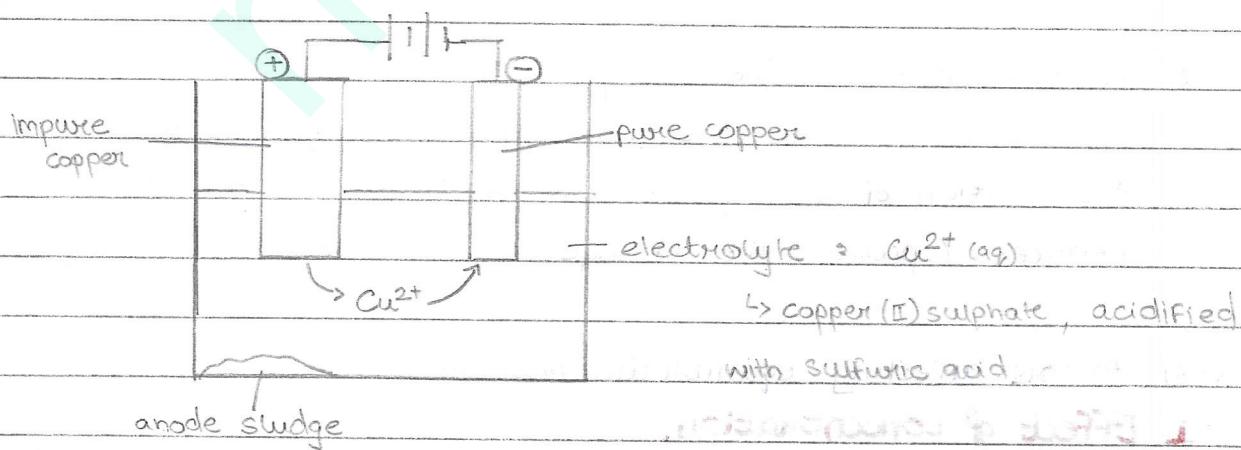

↳  $\text{Cl}^-$  is oxidised because concentration of  $\text{Cl}^-$  is greater than  $\text{OH}^-$

at cathode (reduction)  $2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$

↳  $\text{H}^+$  ions are reduced as they are lower in electronegative chemical series than  $\text{Na}^+$ .

\* As concentration of  $\text{H}^+$  ions reduces, equilibrium shifts to right.

### O - 7) Electrolysis - purification of copper.

at anode (oxidation).  $\text{Cu(s)} \rightarrow \text{Cu}^{2+}(\text{aq}) + 2\text{e}^-$

at cathode (reduction).  $\text{Cu}^{2+}(\text{aq}) + 2\text{e}^- \rightarrow \text{Cu(s)}$

\* The anode decreases in thickness & impurities are deposited as anode sludge.

\* The cathode increases in thickness and when enough pure copper is deposited, it's replaced.
